

## Introduction

---

The latest international evaluation for dairy production traits took place as scheduled at the Interbull Centre. Data from thirty one (31) countries were included in this evaluation.

International genetic evaluations for milk, fat and protein yields of bulls from Australia, Austria-Germany, Belgium, Canada, Czech Republic, Denmark-Finland-Sweden, Estonia, France, Hungary, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Netherlands, New Zealand, Norway, Poland, Republic of South Africa, Slovak Republic, Slovenia, Spain, Switzerland, the United Kingdom, the United States of America, Portugal, Korea, Argentina and Uruguay were computed. Brown Swiss, Guernsey, Holstein, Jersey, Red Dairy Cattle and Simmental breed data were included in this evaluation.

## Changes in national procedures

---

Changes in the national genetic evaluation of production traits are as follows:

NOR RDC      The rolling definition of hys is causing the daughters to distribute somewhat differently over hys-classes at each evaluation. Therefore some bulls occasionally may lose EDC although the number of daughters stay the same. Reliability changes is a function of the EDC changes and have been .02 or lower.

ZAF JER      For this run we included data for ARC herds since 2012 that were previously not available. This caused some changes in averages and sds for certain birth years, especially 2004 and 2005.

ZAF HOL      Corrected error in reliability calculation

ZAF RDC      Inclusion of heterosis and recombination in the model + new calculation of reliability based on PEVs

ISR HOL      Correction of a bug in computation of production records, with respect to handling missing test day records. The correction caused decrease in information

KOR HOL      Some of the sires used for test run had been corrected afterwards using interbull pedigree info (from CAN bulls to USA bulls). And the outcomes of daughter records had been updated accordingly

## DEA BSW/SIM Base change

POL HOL      Base change

EST HOL/RDC    Decrease in number of daughters of some bulls is due to the pedigree check of cows

SVN HOL/BSW    Changes in number of information are mostly consequences of changes in data SIM                 base related to the pedigree completeness as well as phenotypic data improvement.

HRV HOL/SIM    Decreasing reliability for many bulls came from changed pedigree for many animals in data base

DEU HOL/JER    Introduced new editings from test run: all cows must have data in prod+uder RDC                 and all cows must have at least 2 test day records per lactation

IRL JER      MILK: change in sire std of 8% due to addition of new information, small population and previous run being april 2015

ESP HOL      Base change

CHE BSW      Introduced changes in pedigree: Each animal with unverified pedigree got a missing dam, sire or both.

ITA SIM      Base change

HUN HOL New genetic base

HUN SIM Base change

CHE HOL Change in type of proofs and publication rules

CHE SIM Change in type of proofs and publication rules

USA SIM First time in routine run.

USA BSW/GUE Changed unknown parent group definitions  
HOL/JER  
RDC

URY HOL Change in model from ST to MT-TD-RRM

LVA HOL/RDC Base change

PRT HOL New variance components and new heritabilities. There are minimal changes and some corrections in the pedigree and base change+ Did a major review of the data and updated our definitions of official and unofficial bulls.

SVK HOL/SIM Base change

NZL (HOL, JER) Change in parentage verification cause decrease in information

INTERBULL CHANGES COMPARED TO THE DECEMBER ROUTINE RUN

-----  
Subsetting:  
-----  
As decided by the ITC in Orlando, new subsetting was introduced in the september test run. Sub-setting is necessary for operational purposes and restrictions of time scales. To minimize the effect of subsetting, larger subsets with 10-12 countries and with 4 link providing countries have been applied.

Window:  
-----  
According to the decision taken by ITC in Orlando, the following changes have been introduced in regards to the windows used for post processing:

The upper bounds have been set to 0.99 as these were judged to have very little effect on evaluations. The lower values have been set to about the 25% percentile value. The largest changes are for the lower values for conformation traits, with the lowest window being 40% for OFL otherwise it is about 50% for all other confirmation traits. It is anticipated that these low values may not have large impact on evaluations since there were very few countries combinations whose estimated correlations fell between the old limit of 0.30 and these new limits.

## DATA AND METHOD OF ANALYSIS

---

Data were national genetic evaluations of AI sampled bulls with at least 10 daughters or 10 EDC (for clinical mastitis and maternal calving traits at least 50 daughters or 50 EDC, and for direct calving traits at least 50 calvings or 50 EDC) in at least 10 herds. Table 1 presents the amount of data included in this Interbull evaluation for all breeds.

National proofs were first de-regressed within country and then analysed jointly with a linear model including the effects of evaluation country, genetic group of bull and bull merit. Heritability estimates used in both the de-regression and international evaluation were as in each country's national evaluation.

Table 2 presents the date of evaluation as supplied by each country in the 01x-proof file.

Estimated genetic parameters and sire standard deviations are shown in APPENDIX I and the corresponding number of common bulls are listed in APPENDIX II.

## SCIENTIFIC LITERATURE

---

The international genetic evaluation procedure is based on international work described in the following scientific publications:

### International genetic evaluation computation:

Schaeffer. 1994. J. Dairy Sci. 77:2671-2678  
Klei, 1998. Interbull Bulletin 17:3-7

### Verification and Genetic trend validation:

Klei et al., 2002. Interbull Bulletin 29:178-182.  
Boichard et al., 1995. J. Dairy Sci. 78:431-437

### Weighting factors:

Fikse and Banos, 2001. J. Dairy Sci. 84:1759-1767

### De-regression:

Sigurdsson and G. Banos. 1995. Acta Agric. Scand. 45:207-219  
Jairath et al. 1998. J. Dairy Sci. Vol. 81:550-562

### Genetic parameter estimation:

Klei and Weigel, 1998, Interbull Bulletin 17:8-14  
Sullivan, 1999. Interbull Bulletin 22:146-148

### Post-processing of estimated genetic correlations:
