Considerations in using quantitative measurements of milking speed for genetic evaluations for all dairy breeds in the USA

João Dürr, Robert Fourdraine, Steven Sievert, Kristen Gaddis, Jeffrey Bewley, Sophie Eaglen, Jay Weiker, Jana Hutchison, and Asha Miles

Council on Dairy Cattle Breeding Milking Speed Task Force

Scope of Task Force

- Evaluate the economic importance of providing milk speed evaluations
- Review the existing data types and develop a clear definition of the trait to be adopted by CDCB and member sectors
- Assess the status of milking speed data availability and access within the DRP/DRPCs
- Identify the steps needed to develop a milking speed data pipeline into the National Cooperator Database
- Suggest quality standards for milking speed data
- Provide a full implementation plan, defining roles and responsibilities, costs, timeline, and deliverables

Existing Evaluations for Milking Speed

- Interbull-participating countries (N = 14) include milking speed in their "workability" evaluations
 - Australia, Canada, Denmark/Sweden/Finland, France,
 Germany/Austria/Luxembourg, Great Britain, Italy, Japan, the
 Netherlands, New Zealand, Norway, Poland, Slovenia, and Switzerland

- Nearly all phenotypes collected during first parity only and sometimes from a single classification
- If milk flow rates were available, classification data were discarded

From April 2022 MACE "Workability" Report

LAPPENDIX I. Sire standard deviations for milking speed in diagonal and genetic correlations below diagonal

ICAR-Interbull Meeting | Montreal, CAN | May 30th 2022 | (4)

Literature Review

Regarding quantitative milking speed

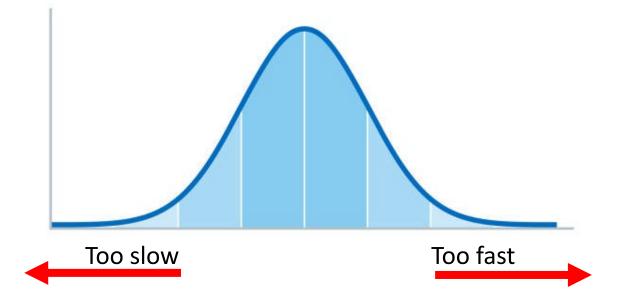

- Heritabilities range from 0.02 0.42
 depending on the trait definition
- Repeatabilities range from 0.40 0.54
- Conflicting evidence of variation in milking speed across lactations
- Favorable correlations between milking speed and milk yield
- Unclear relationship between udder health and milking speed

Literature Review

Milking Speed is an intermediate-optimum trait

- How does milking speed change by stage in lactation?
- How many times should a cow be sampled to get an accurate phenotype?
- How would producers use milking speed data?
- Can conventional and AMS herds be evaluated together?

Data Types & Availability

Million Conserved

• Format 6 includes milking "speed", but there have only been 21 records submitted to the NCD since 2006

miking speed	
A cow with faster than average milking speed (7) on a 9-point scale	
MSPD20031004A00907-	
A cow that took 10 minutes and 30 seconds of actual time to milk out	Milking duration
MSPD20031004AT1030-	

• Limited archival data in herd management software

Trait Definition & Quality Standards

Milking Speed = lbs/min

Quality Control Edits				
	Holstein Only			
Data Sparsity	Last 150 d Only			
	> 10 records per cow			
	15 min > DURATION > 0 min			
Recording errors	60 lbs > WEIGHT > 0 lbs			
	15 lbs/min > SPEED > 0 lbs/min			
Biological phenomena	10 > DIM > 305			

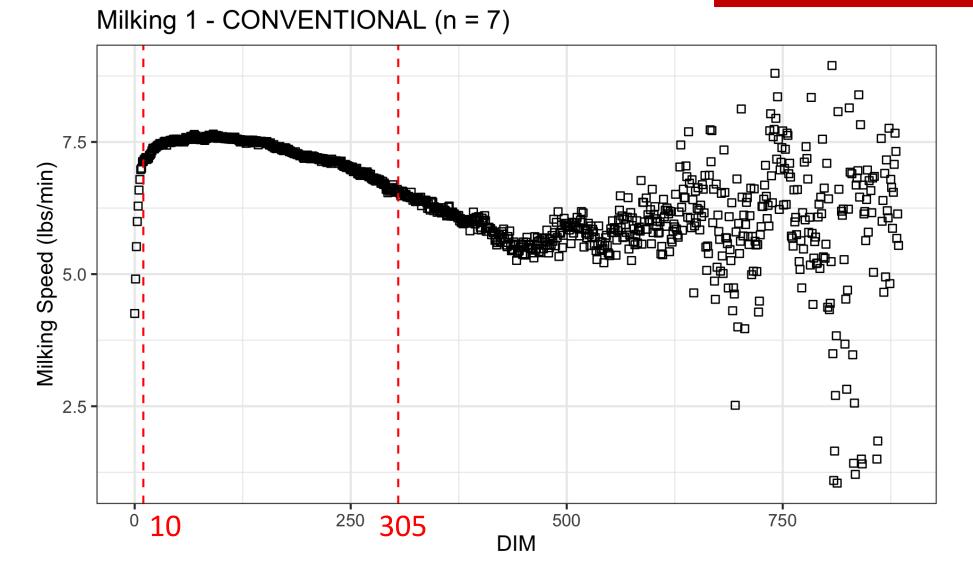

Conventional Herds (n = 7)

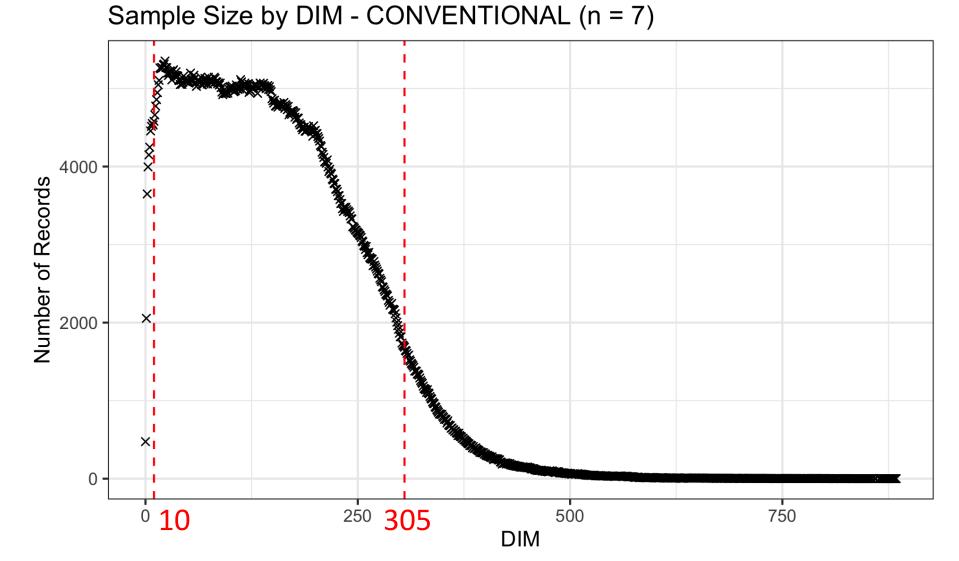

Milking Speed : Milk Yield Correlations 0.52 – 0.58

USDA

AGIL – Miles

Conventional Herds

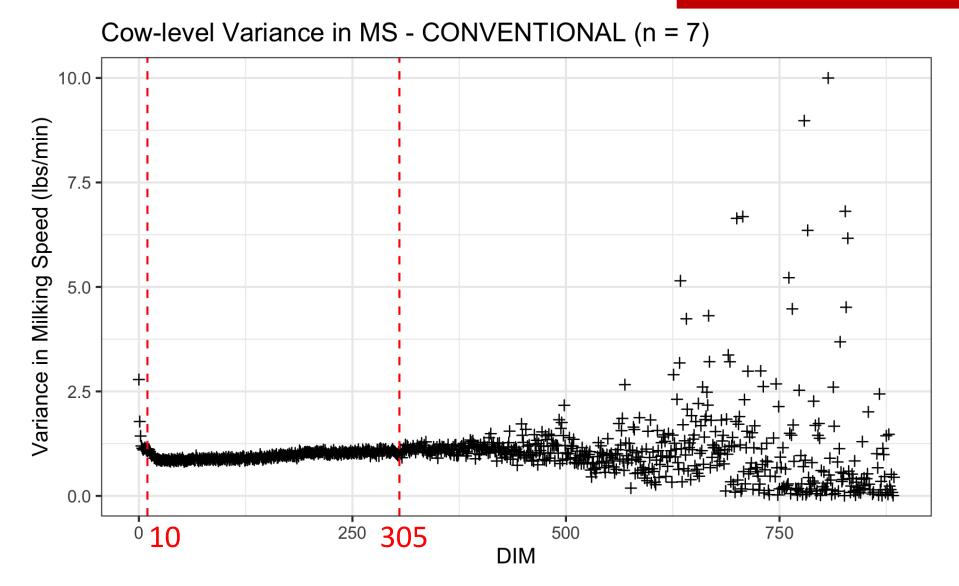

Conventional Herds

DEN/FIN/SWE: 30 – 240 DIM NOR: 20-300 DIM

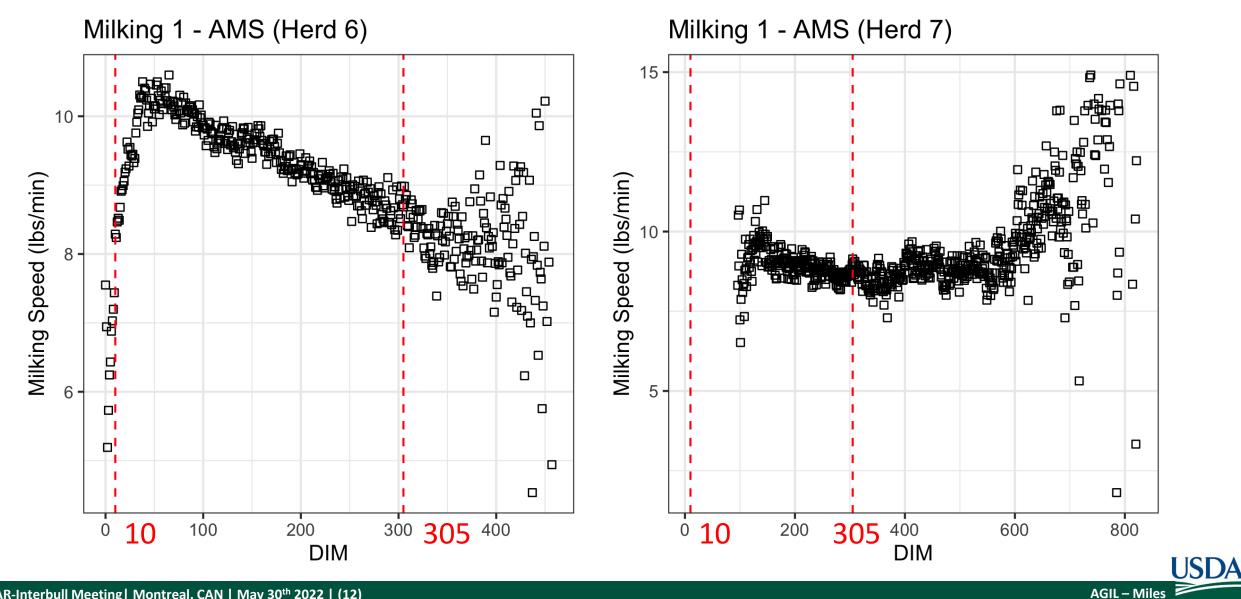

USDA

AGIL – Miles

AMS Herds (n = 2)

Milking Speed : Milk Yield Correlation ~0.5 - 0.6

ICAR-Interbull Meeting | Montreal, CAN | May 30th 2022 | (12)

- AMS cows milk faster than conventional cows
- MS is slightly faster for milkings earlier in the day
- Milking interval is not correlated with milking speed in conventional herds; more investigation is needed regarding AMS herds
- First lactation cows have slower average MS than multiparous cows

What don't we know?

Other Considerations					
	Meter manufacturer	Time in parlor			
	Automatic take-off	Incomplete udder evac			
System Effects	Variable pulsation ratios	Automatic ID detection & validation			
	Milking frequency	Milking interval			
	Individual meter effect	Calibration protocol			
	Stage in lactation	Season/Region effects			
Biological Effects	Breed	Cow effects			
	Parity				

Proposed Research

Obj. 1: Assemble a high-quality dataset pertinent to milking speed and capturing U.S. dairy systems demographics, especially relating to different dairy breeds and milking management

- **Obj. 2:** Develop clear definition for milking speed considering availability of data types, their respective heritabilities, and suitability for selection purposes
- **Obj. 3:** Characterize any biological effects that impact milking speed, especially the relationship of milking speed to udder health
- **Obj. 4**: Quantify the influence of system effects on milking speed, including milking system (conventional v. AMS), meter manufacturer, and milking management factors

Thank you. Questions?

Special thanks to task force members for their efforts
