

# Is Farmeromics the missing 'omic'?

Michelle Axford

AGRICULTURE VICTORIA

Ensuring that recording practices are consistent and accurate will make genetic selection for improving calf health feasible. While the potential

Ontario Farmer, Feb 2024

**sure, blame the  
lazy farmers**

SB was higher in smaller calves compared with larger calves. However, in Australia improvement in data recording practices is needed, to facilitate routine genetic evaluations.

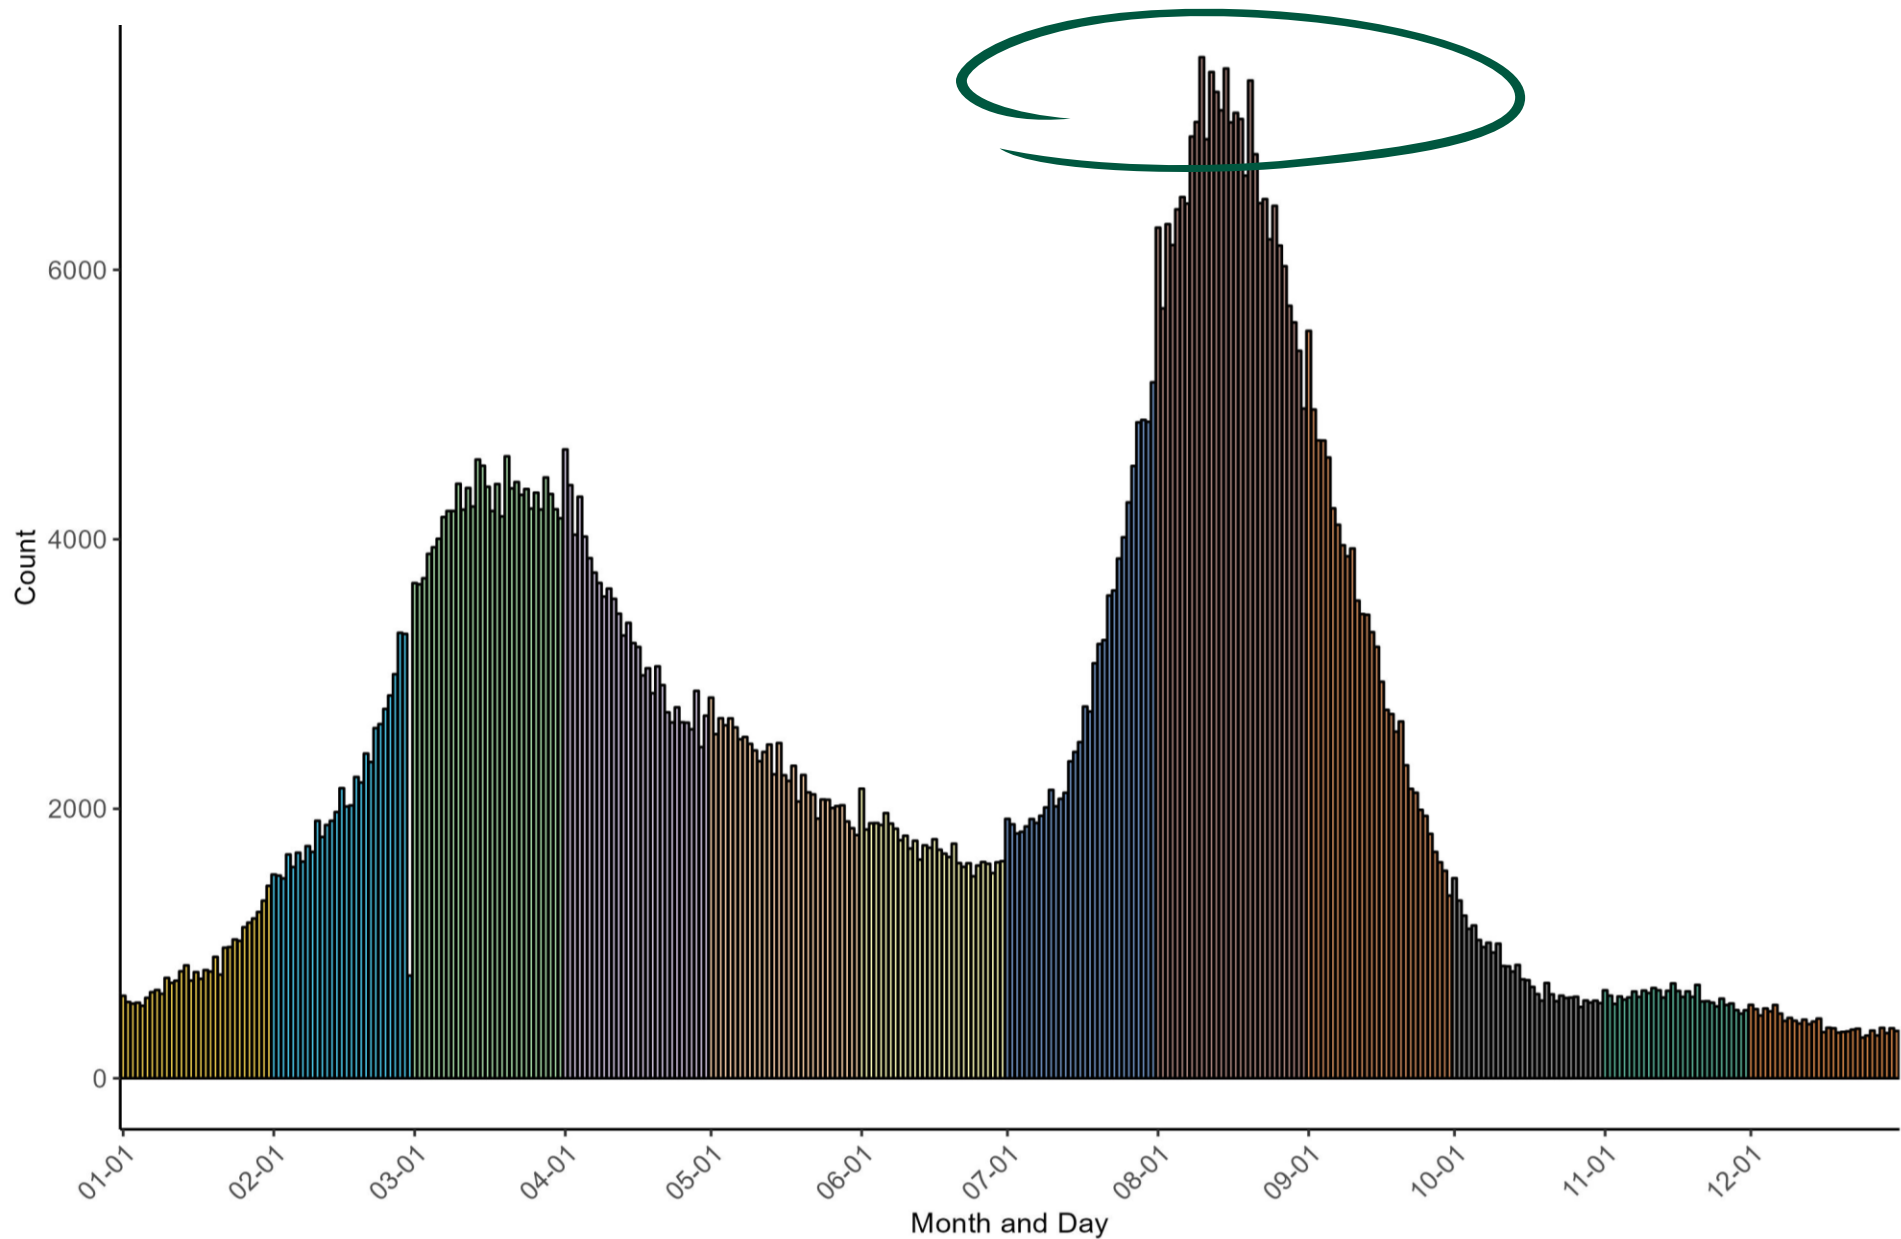

Axford et al., 2024

# Calving observations with fate and ease recorded, over time.

# Distribution of calving dates

DataGene CDR 2014-2023

**can we advance our research with ‘farmeromics’**

# Farmeromics

**“the study of farmer-driven,  
biological data recording, at scale”**

# Farmeromics

What problems do farmers want to fix,  
using data?

What is the motivation to record?

**farmer-driven,**

# Farmeromics

## biological data

What data do you want?

What data might be available?

# Farmeromics

Do the recording practices fit?

**recording, at scale”**

Have we asked?

## Example 1: Calf vitality

January 21, 2018 · 🌐

Anybody else's calves acting stupid tonight? Or is it just mine?

5 Comments

## Example 1: Calf vitality

Dead

Dud

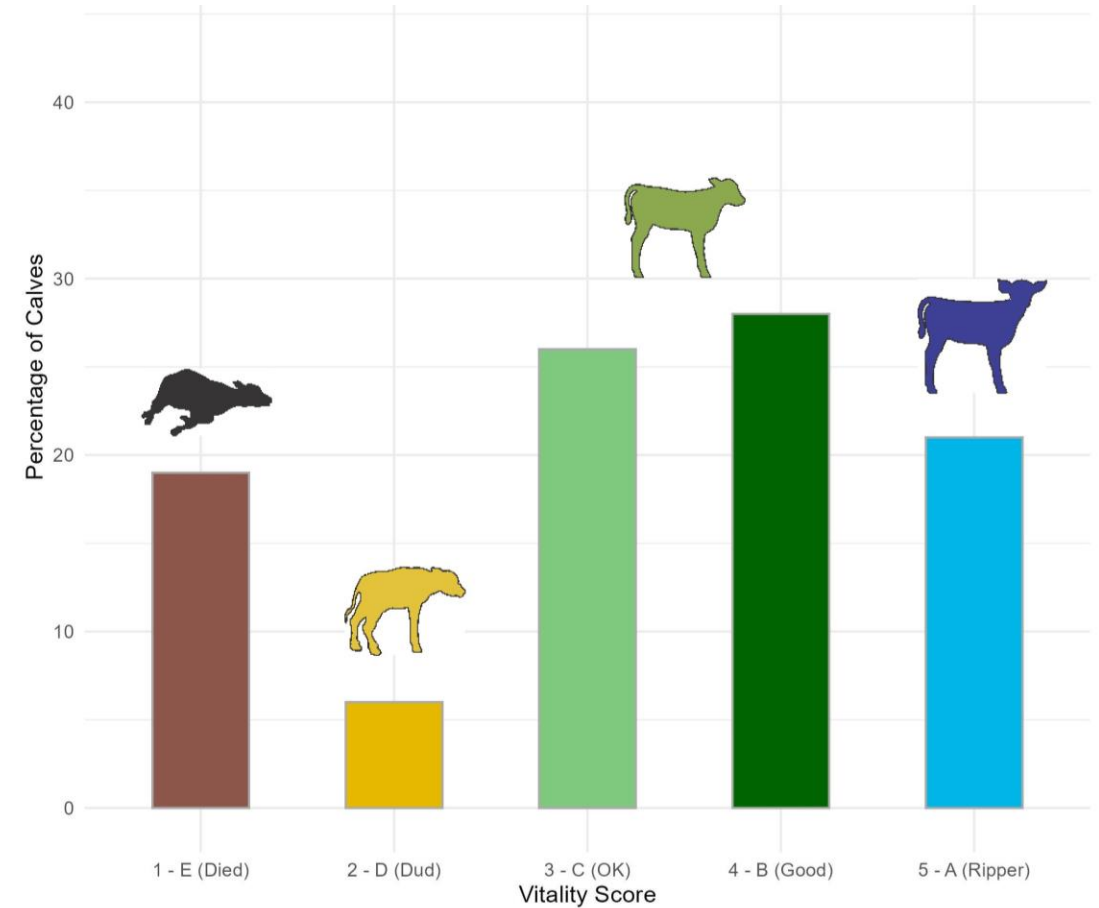

OK

Ripper

## Example 1: Calf vitality

- Idea developed with calf participants
- Highest heritability (11%)
  - Subjective scoring, continuous trait
  - Avoids 'diagnosis'
  - Favourably correlated with health and scours
- Trait with the most community interest
- Only half of the participants recorded
- Would require farm software upgrades to scale its collection

## Example 2: Feeding the Genes

*Is semen from high merit bulls a wise economic decision for my farm?*

*Are daughters of high merit bulls more likely to crash and burn?*

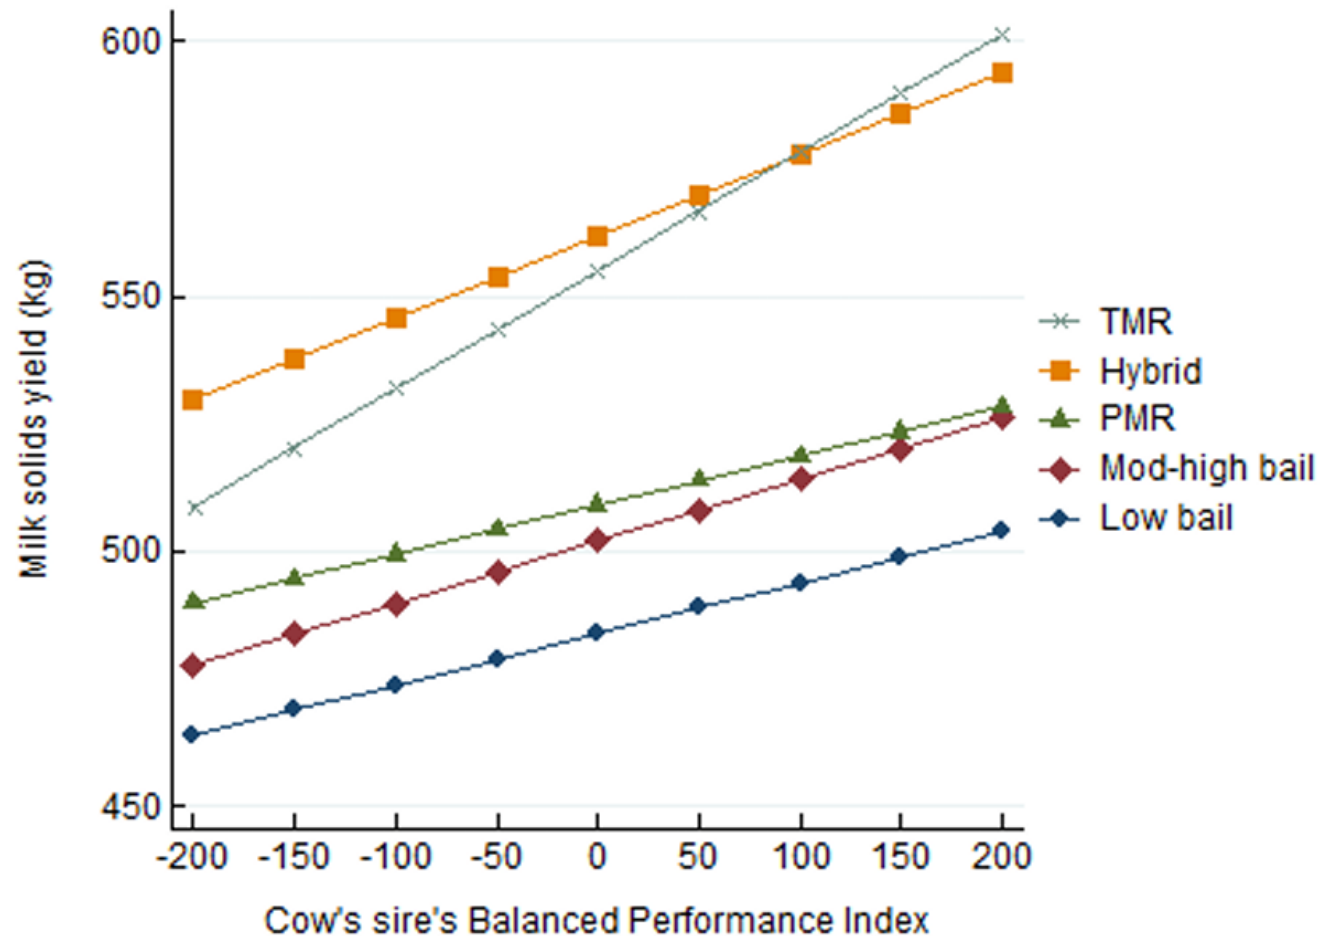

*Do genetics make a difference in all feeding systems?*

*Do I need to feed high rates of supplements to benefit from high merit bulls?*

## Example 2: Feeding the Genes

- Aimed to answer farmer questions
- Feeding system data wasn't easily accessible
  - Short survey **5** questions
  - Carefully crafted invitation to targeted herds
  - Multi-disciplinary team that included well-known spokespeople
  - High response rate (24%)

Morton et al, 2013

## Have you examples where farmers have

- changed something that lifted a project's practicality and/or efficiency,
- revealed new data through discussion,
- fine-tuned the research question, or
- made the discoveries more meaningful.

# Is it worthwhile studying

- What problems do farmers want to fix, using data?
- What is the motivation to record?
- What data might be available?
- Do the recording practices fit?
- How do we ask?

**Can we avoid writing  
the easiest sentence to write?**
