

Introduction

The latest routine international evaluation for **conformation** traits took place as scheduled at the Interbull Centre. Data from twenty four (24) countries were included in this evaluation.

International genetic evaluations for calving traits of bulls from Australia, Belgium, Canada, Switzerland, Czech Republic, Germany, Denmark-Finland-Sweden, Spain, France, United Kingdom, Hungary, Ireland, Italy, Japan, Korea, The Netherlands, Norway, New Zealand, Poland, South Africa, Estonia, Slovenia, Portugal and the United States of America were computed. Brown Swiss, Guernsey, Holstein, Jersey and Red Dairy Cattle breed data were included in this evaluation.

Changes in national procedures

Changes in the national genetic evaluation of conformation traits are as follows:

POL HOL There were some changes in data editing.

SVN HOL Participating with BCS for the first time. Change of genetic reference base - using population average now. Genetic parameters were re-calculated.

GBR HOL Change of organization - data now being provided by SRUC.

USA BSW/JER Standard deviation for composite traits OUS and OFL for BSW and JER were modified to match the changes to individual traits implemented in December 2016.

USA JER RTP added as a new trait to replace the use of a substitute trait (FTP) used previously.

DFS HOL/RDC Conformation traits have been re-submitted because of a minor error in the standardization procedure for udder depth in the most recent years. The error has been corrected.

CHE BSW/HOL Base change.

CHE BSW The effect of stage of lactation is now partitioned into more levels than in the old models. Application of a new plausibility criteria with respect to days in milk and age at calving. This causes a decrease in number of daughters for many bulls. Correction of an error in the conversion of linear scores for body depth to body depth in cm. Changes in the deduction of the levels for the classifier*half-year-effect. To count the number of herds only 1st lactation daughters are now considered. Previously daughters that have been classified again in subsequent lactations, were counted again.

FRA BSW/HOL Base change. For HOL also inclusion of FRR in FRA population.

ITA HOL Base change. Rolling base for all traits (one year cut-off data).

DEU HOL/RDC Base change.

DEA BSW Base change.

JPN HOL There were additional records added and pedigree was modified causing small changes in proofs.

EST HOL There is a decrease in the number of daughters/herds and reliability of some bulls is due to the updated pedigree of some cows.

CAN BSW/JER/ Base change.
GUE/HOL/
RDC

AUS BSW/JER/ Base change.
GUE/HOL/
RDC

NZL BSW/JER/ New Zealand has continuous DNA parentage testing therefore daughter counts, herd counts, edc and reliability are subjected to changes.

RDC

INTERBULL CHANGES COMPARED TO THE DECEMBER ROUTINE RUN

Sub-setting:

As decided by the ITC in Orlando, new sub-setting was introduced in the September test run. Sub-setting is necessary for operational purposes and restrictions of time scales. To minimize the effect of sub-setting, larger subsets with 10-12 countries and with 4 link providing countries have been applied.

Window:

According to the decision taken by ITC in Orlando, the following changes have been introduced in regards to the windows used for post processing:

The upper bounds have been set to 0.99 as these were judged to have very little effect on evaluations. The lower values have been set to about the 25% percentile value. The largest changes are for the lower values for conformation traits, with the lowest window being 40% for OFL otherwise it is about 50% for all other confirmation traits. It is anticipated that these low values may not have large impact on evaluations since there were very few countries combinations whose estimated correlations fell between the old limit of 0.30 and these new limits.

DATA AND METHOD OF ANALYSIS

Data were national genetic evaluations of AI sampled bulls with at least 10 daughters or 10 EDC (for clinical mastitis and maternal calving traits at least 50 daughters or 50 EDC, and for direct calving traits at least 50 calvings or 50 EDC) in at least 10 herds. Table 1 presents the amount of data included in this Interbull evaluation for all breeds.

National proofs were first de-regressed within country and then analysed jointly with a linear model including the effects of evaluation country, genetic group of bull and bull merit. Heritability estimates used in both the de-regression and international evaluation were as in each country's national evaluation.

Table 2 presents the date of evaluation as supplied by each country

Estimated genetic parameters and sire standard deviations are shown in APPENDIX I and the corresponding number of common bulls are listed in APPENDIX II.

SCIENTIFIC LITERATURE

The international genetic evaluation procedure is based on international work described in the following scientific publications:

International genetic evaluation computation:

Schaeffer. 1994. J. Dairy Sci. 77:2671-2678
Klei, 1998. Interbull Bulletin 17:3-7

Verification and Genetic trend validation:
