## introduction

The latest genomic routine international evaluation for longevity trait took place
as scheduled at the Interbull Centre. Data from 21 populations were and in the Interbu

International genetic evaluations for direct longevity trait of bulls from
Australia, Belgium, Canada, Switzerland, Germany, Denmark-Finland-Sweden
Australia, Beicium, Unada, Sindzer, Ind, German,
Spain, France, The United Kingdo, Ieland, Israel,
Italy, New Zealand, The Netherlands, The United States of America
Italy, New Zealand, The Netherlands, The United States
Hungary, Norway, siovenia and Czech Republic were comp
Holstein breed data were included in this evaluation.
bei, CAN, DEU, ESP, FRA, DFS, GBR, ITA, NLD, hUN submitted GEBVs.
dlo: bel, CAN, deu, esp, fRa, dFs, gbr, ita, nld, hun

Changes in national procedures
hanges in the national genetic evaluation of longevity traits are as follows:
NLD (HOL) New added edc from a new validation affecting GREL and SD
BEL (HOL) Same data as August but after correcting some run bugs and removing some previous adjustments
HUN (HOL) Changes affecting genomic EDC
ESP (HOL) Stopped incorporating candidates and culled bulls older than 2 years old in the genomic evaluation
INTERBULL CHANGES COMPARED TO THE AUGUST ROUTINE RUN
Starting with the December 2019 evaluation, the GMACE software was updated to ensure GMACE reliabilities are always at least 1 point higher than the corresponding reliabilities of MACE parent averages.
This update affects bulls from countries with extremely low national genomic reliabilities for a given trait This update affects bulls from countries with extremely low natio.
The vast majority of GMACE results were unaffected by the update.
data and method of analysis
Eleven Holstein populations sent GEBV data for up to 38 traits, while
classical EBVs for the same traits were used in the analyses. Young bul
GEBVS from the GEBV providers have been converted to the scaies of all
countries participating in classical MACE. A bull will get a MACE EBV or
a GMACE EBV but not both.
From those eleven countries, National GEBVs of bulls less than seven years of age and with no with a further requirement of either a MACE-PA or a GMACE-PA (for young
with a further requirement of either a MACE-PA or a GMA
genomic bulls with young genomic sires) being available
The parameter-space approach is used for the GMACE genetic evaluations (Sullivan, 2016 )
SCIENTIFIC LIterature
The international genetic evaluation procedure is based on international work
