

## Introduction

The latest international evaluation for dairy production traits took place as scheduled at the Interbull Centre. Data from thirty-three (33) countries were included in this evaluation.

International genetic evaluations for milk, fat and protein yields of bulls from Australia, Austria-Germany, Belgium, Canada, Croatia, Czech Republic, Denmark-Finland-Sweden, Estonia, France, Hungary, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Netherlands, New Zealand, Norway, Poland, Republic of South Africa, Slovak Republic, Slovenia, Spain, Switzerland, the United Kingdom, the United States of America, Portugal, Korea, and Uruguay were computed. Brown Swiss, Guernsey, Holstein, Jersey, Red Dairy Cattle and Simmental breed data were included in this evaluation.

## Changes in national procedures

Changes in the national genetic evaluation of production traits are as follows:

IRL (HOL,JER,RDC,SIM) Few bulls dropping small number of daughters - due to ongoing genotyping picking up incorrect sires.  
BEL (HOL) Few bulls missing due to drop in daughters, changes in type of proofs caused by the program assigning them.  
DEA (BSW) Drops in info causing changes in rel.  
ISR (HOL) Some bulls had slight reductions in the numbers of records, due to editing and parentage corrections.  
JPN (HOL) Changes in information caused by additional records and modification of pedigree.  
NZL (ALL) Changes in information caused by continuous DNA parentage testing.  
DFS (HOL,JER,RDC) Changes in type of proofs, Type of proof is based information from production.  
When production information for foreign bulls comes, they might change type of proof for other traits from unknown to XX, drops in information.  
DEA (BSW,SIM) Pedigree corrections leading to expected decreasing reliabilities in few bulls.  
Some bulls changed to TOP 21 because of updated registration data  
SVN (ALL) Small changes in information due changes in data base related to the pedigree completeness as well as phenotypic data improvement.  
ITA (SIM) Some drops in information due to edits on very old test day records used to estimate the ebvs and some pedigree's correction.  
ESP (HOL) Base change.  
ZAF (HOL,JER) Reliabilities estimated with Jamrozik et al. method.  
LTU (HOL) Decrease in information due to pedigree correction for old animals.

## INTERBULL CHANGES COMPARED TO THE PREVIOUS ROUTINE RUN

### Post-processing Windows:

According to the decision taken by ITC in Orlando (2015) to review the post-processing windows every 5 years, during the 2020 the relative working group has been re-activated and new windows have been identified.

As before, the upper bounds have been set to 0.99 as these were judged to have very little effect on evaluations while the lower values have been reduced to the 10th percentile. This reduction would provide post-processed correlations to be closer to the real estimated ones. Over the past five years, in fact, the previous adopted lower value (25th percentile) had been found too high causing estimated and post-processed correlations to differ significantly from each other. The new lower values have been applied to all breeds and traits.

The weight assigned to the magnitude of the changes tested by each country has also been revised. The new weight will allow post-processed correlations to take more in consideration the value of the new estimated ones even when no changes are applied by the countries.

The new weights are as follows:

No changes :: 2  
Small changes:: 1  
Big changes :: 0

More information can be read on [https://interbull.org/ib/rq\\_procedure](https://interbull.org/ib/rq_procedure)

#### DATA AND METHOD OF ANALYSIS

Data were national genetic evaluations of AI sampled bulls with at least 10 daughters or 10 EDC (for clinical mastitis and maternal calving traits at least 50 daughters or 50 EDC, and for direct calving traits at least 50 calvings or 50 EDC) in at least 10 herds. Table 1 presents the amount of data included in this Interbull evaluation for all breeds.

National proofs were first de-regressed within country and then analysed jointly with a linear model including the effects of evaluation country, genetic group of bull and bull merit. Heritability estimates used in both the de-regression and international evaluation were as in each country's national evaluation.

Table 2 presents the date of evaluation as supplied by each country

Estimated genetic parameters and sire standard deviations are shown in APPENDIX I and the corresponding number of common bulls are listed in APPENDIX II.

#### SCIENTIFIC LITERATURE

The international genetic evaluation procedure is based on international work described in the following scientific publications:

#### NEXT ROUTINE INTERNATIONAL EVALUATION

Dates for the next routine evaluation can be found on  
<http://www.interbull.org/ib/servicecalendar>.

#### NEXT TEST INTERNATIONAL EVALUATION

Dates for the next test run can be found on  
<http://www.interbull.org/ib/servicecalendar>.

PUBLICATION OF INTERBULL ROUTINE RUN

Results were distributed by the Interbull Centre to designated representatives in each country. The international evaluation file comprised international proofs expressed on the base and unit of each country included in the analysis. Such records readily provide more information on bull performance in various countries, thereby minimizing the need to resort to conversions.

At the same time, all recipients of Interbull results are expected to honor the agreed code of practice, decided by the Interbull Steering Committee, and only publish international evaluations on their own country scale. Evaluations expressed on another country scale are confidential and may only be used internally for research and review purposes.

PUBLICATION OF INTERBULL TEST RUN

Test evaluation results are meant for review purposes only and should not be published.
