

Introduction

The latest routine international evaluation for **udder traits** took place as scheduled at the Interbull Centre. Data from twenty seven (27) countries were included in this evaluation.

International genetic evaluations for udder health traits of bulls from Australia, Austria-Germany, Belgium, Canada, Czech Republic, Denmark-Finland-Sweden, Estonia, France, Hungary, Ireland, Israel, Italy, Japan, Netherlands, New Zealand, Norway, South Africa, Slovak Republic, Spain, Switzerland, the United Kingdom, the United States of America, Poland, Lithuania, Latvia, Croatia, Slovenia and Portugal were computed. Brown Swiss, Holstein, Red Dairy Cattle, Guernsey, Jersey and Simmental breed data were included in this evaluation.

Changes in national procedures

Changes in the national genetic evaluation of udder health traits are as follows:

NOR (RDC)	The rolling definition of hys is causing the daughters to distribute somewhat differently over hys-classes at each evaluation. Therefore some bulls occasionally may lose EDC although the number of daughters stay the same. Reliability changes is a function of the EDC changes.
SVN (BSW,HOL,SIM)	Changed the definition of genetic reference base. As genetic reference base we use population average. Genetic parameters were recalculated
LTU (HOL,RDC)	Base change
IRL (HOL)	Base change
CHE (BSW,HOL,SIM)	Base change
FRA (HOL)	Inclusion of HOLFRR in HOLFRA, base change
FRA(BSW,SIM)	Base change
FRM(SIM)	Base change
NLD (ALL)	Introduction of the 4th and 5th lactation.
ITA (HOL)	Base change plus one year cut-off data
DEU (HOL,RDC)	Base change
NZL (ALL)	Continuous DNA parentage testing therefore daughter counts, herd counts, edc and reliability are subjected to changes
JPN (HOL)	Little changes in proofs caused by additional records and modification of pedigree.
DEA (BSW,SIM)	Base change
EST (HOL,RDC)	Pedigree updates for some cows
GBR (ALL)	Participating with MAS data for the first time
CAN (ALL)	Base change
ITA (SIM)	Base change, inclusion of Interbull pedigree in national one's so to have a deeper pedigree structure; new updated reliability software (accf90) which causes decreases in reliability
AUS (ALL)	Base change

INTERBULL CHANGES COMPARED TO THE DECEMBER ROUTINE RUN

Sub-setting:

As decided by the ITC in Orlando, new sub-setting was introduced in the September test run. Sub-setting is necessary for operational purposes and restrictions of time scales. To minimize the effect of sub-setting, larger subsets with 10-12 countries and with 4 link providing countries have been applied.

Window:

According to the decision taken by ITC in Orlando, the following changes have been introduced in regards to the windows used for post processing:

The upper bounds have been set to 0.99 as these were judged to have very little effect on evaluations. The lower values have been set to about the 25% percentile value. The largest changes are for the lower values for conformation traits, with the lowest window being 40% for OFL otherwise it is about 50% for all other confirmation traits. It is anticipated that these low values may not have large impact on evaluations since there were very few countries combinations whose estimated correlations fell between the old limit of 0.30 and these new limits.

DATA AND METHOD OF ANALYSIS

Data were national genetic evaluations of AI sampled bulls with at least 10 daughters or 10 EDC (for clinical mastitis and maternal calving traits at least 50 daughters or 50 EDC, and for direct calving traits at least 50 calvings or 50 EDC) in at least 10 herds. Table 1 presents the amount of data included in this Interbull evaluation for all breeds.

National proofs were first de-regressed within country and then analysed jointly with a linear model including the effects of evaluation country, genetic group of bull and bull merit. Heritability estimates used in both the de-regression and international evaluation were as in each country's national evaluation.

Table 2 presents the date of evaluation as supplied by each country

Estimated genetic parameters and sire standard deviations are shown in APPENDIX I and the corresponding number of common bulls are listed in APPENDIX II.

SCIENTIFIC LITERATURE

The international genetic evaluation procedure is based on international work described in the following scientific publications:

International genetic evaluation computation:
